

How to have User Stories?

To have meaningful user stories, you must follow the I.N.V.E.S.T rules.

Independent-Stories must be independent of one another to develop sprints separately

Negotiable-Stories must allow developers to negotiate changes for the stories at any time.

Valuable-User stories need to have a significant value to consumers/users, hence the purpose of user stories.

Estimable-Developers need to estimate the story size to help better prioritize functionalities and set achievable acceptance criteria.

Small-Project needs to be small and could be developed within 1-4 days

Testable-Product is tested to achieve an acceptable criterion.

All User stories are mentioned below

My name is Joe. I am a First Year University student, and I would want this website to have a menu bar so that it will be easy for me to navigate the educational app and therefore allow for faster navigation.

My name is Jill, and I am a 40-year veteran teacher. I may have gotten used to old school teaching but still I want to have this app. I would want this app to have previews of the contents of the app and what it does.

My name is Roy, and I have been a programmer for 20 years. As someone who has taken countless online courses on emerging technology, I would want this app to have a card function on the front page of the app. So that I could have a full preview of the app's contents and therefore have an idea of what I will be doing.

My name is Max, and I am a second-year university student. As a student, I would want this app to have video functions that would allow me to add photos or files into the educational app. I want this feature because it will allow me to better ask questions and clarify corrections in lessons.

My name is Jim, and I have been an IT teacher for 5 years. As a teacher I would want this app to have booking and notification functions. I want these functions because I want to make it easier for students to have appointments with me regarding tutorials or any further enquiries.
